Updating the Slow Dough website

MANAGER QUICK GUIDE · DAILY MENU · BLOG · DOUGH ANNOUNCEMENT · OPENING HOURS

Editor: `smagara.github.io/SlowDoughPizzaSite_Sveltia/admin/`
Sign-in: your GitHub account (you must be a collaborator)
Works best in Chrome or Edge on a laptop

What you can change yourself

- **Menu Items** — every dish and drink: description, price, badges, position, on/off the menu
- **Menu Sections** — the headings the menu is grouped under
- **Blog Posts** — write, edit or hide essays in “The Baker’s Journal”
- **Dough Announcement** — the dark strip at the top of every page
- **Opening Hours** — times and notes for each day

How publishing works

- You edit and click **Save**, then **Send for Review**.
- Each item you save becomes its own *pull request* on GitHub (a “Draft” one until you send it) — the live site is **not** changed yet.
- A reviewer approves it; the website updates itself about 2–3 minutes later and the card leaves the board.
- Nothing you do in the editor can break the live site — every change is checked and reviewed first.

1 Open the editor and sign in

The editor is **not linked from the website** (so visitors and search engines never see it). Type the address below once and **bookmark it**:

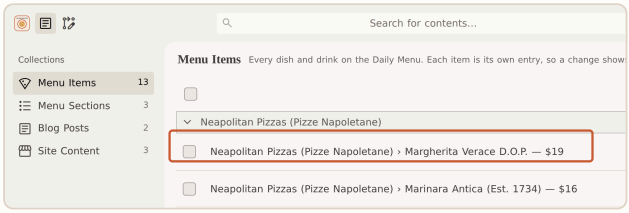

`https://smagara.github.io/SlowDoughPizzaSite_Sveltia/admin/`

Click **Sign In with GitHub** and approve the request in the GitHub window. (If the site owner gave you an *access token* instead, use “Sign In Using Access Token” and paste it once — your browser remembers it, and next time the editor opens straight away.)

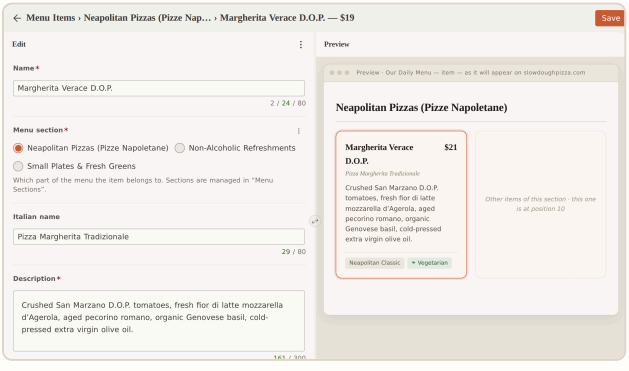

2 Pick what you want to change

The editor opens on **Menu Items**, grouped by section — click a dish to change it. **Menu Sections** holds the headings, **Blog Posts** the essays, and **Site Content** the menu introduction, **Dough Announcement** and **Opening Hours**.

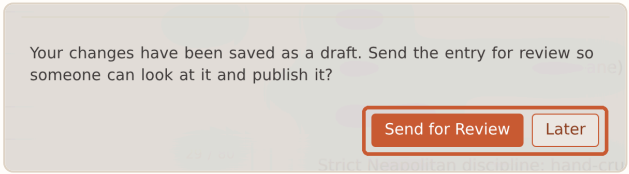

3 Make your change

Change the text, price or badges (green counters show the room left); pick the **Menu section**; set **Position in section** (lowest number first — 10, 20, 30 leaves room to slot a dish in). Switch **Show on menu** off for a sold-out dish instead of deleting it. **New** adds a dish. The **Preview** on the right shows the item as it will look on the website.

4 Save, then Send for Review

Click **Save** (top right). The editor confirms that your change was saved as a draft and asks whether to send it for review — click **Send for Review**.

The item now shows In Review. Choose **Later** only if you want to keep editing before anyone looks at it; the change then waits as a Draft — saved and safe, but nobody is asked to review it — until you send it.

5 Wait for approval — then it’s live

The reviewer gets your change as a GitHub pull request, reads exactly what changed and approves it. The website rebuilds itself and your update appears a few minutes later — nothing more to do.

Follow progress on the **Editorial Workflow** board (branch icon, top of the editor): each card names the change, e.g. *Neapolitan Pizzas › Margherita — $21*. Use **Drafts** and **In Review** only; once merged, the card disappears and the change is live.

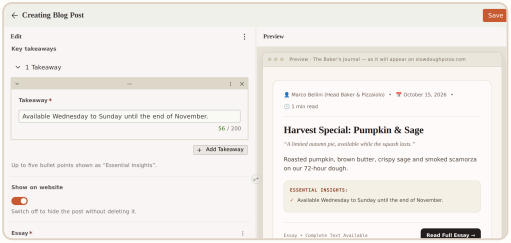

Writing a blog post

Open **Blog Posts → New**. Fill in the **Title**, a one-line **Subtitle**, **Author**, the **Publish date** (posts are listed newest first), choose an **Illustration** and write a short **Excerpt** for the card. Add up to five **Key takeaways** — they appear as “Essential Insights”.

Write the **Essay** in the large box. Use the toolbar (or type at the start of a line): **Heading 2** (`##`) for section titles, **Quote** (`>`) for a pull-quote, **Bold**/**Italic**, bullet lists and links. Plain text only — the site applies the fonts and colours.

Show on website hides a post without deleting it (e.g. a seasonal post). Editing an existing post works the same way: open it from the list, change, Save, Send for Review.

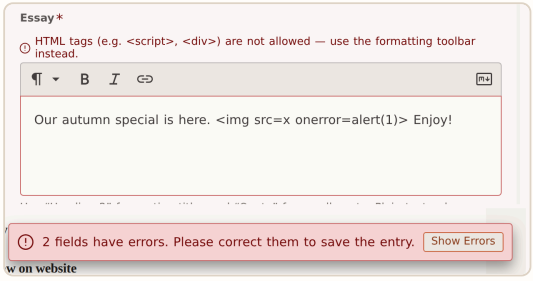

> The file name (“slug”) is made from the title when you first save — keep titles short and descriptive.

Rules the editor enforces

The form checks your text when you click Save. If something is wrong, the field is outlined in red with a message and a banner says how many fields need attention — the change is **not** saved until they are fixed.

- Required fields (marked *) cannot be empty.
- Every text field has a maximum length (see the counter).
- The characters **<** and **>** and anything that looks like web code (such as **<script>** or ** **) are not allowed — paste plain text only. Copying from Word or a web page can bring hidden code along; if you see this error, retype the sentence.
- Prices are numbers between 0 and 500 (use 12.5 for $12.50). The Opening Hours always list seven days — change the times and notes, not the days.

If something looks wrong

What you see	What to do
My change is not on the website yet.	It has probably not been approved yet — check the Editorial Workflow board. After approval, allow 2–3 minutes and refresh the page (Ctrl/⌘ + Shift + R).
The editor opens but shows nothing to edit (empty lists or blank fields).	Don’t re-type everything — tell the site developer. The editor is reading a branch of the website project that has no content on it (a set-up issue, not your mistake).
“You don’t have access to the repository.”	Your GitHub account is not a collaborator on the website repository. Ask the site owner to add you (Settings → Collaborators) and sign in again.
“N fields have errors.”	Click **Show Errors**, fix the outlined fields (see the rules above) and Save again.
Old text shown, or “the branch has moved”.	Reload the editor — it fetches the latest content. If someone else changed the same item, re-open it and redo your edit.
I want to change or undo something.	Still “In Review”: open the item again, edit and Save — the same request is updated; or discard it with the ↶ button on its card on the board. Already live: make the opposite change, or ask the reviewer to revert it on GitHub.
